

RK RESIDENCY

THE GOD-LEVEL MASTER PROMPT

Full-Stack Booking Website + Admin Panel — Vrindavan Heritage Luxury Theme

A single, paste-ready master prompt engineered to push any AI coding tool (Claude Code, Cursor, v0, bolt.new, or similar) toward a cinematic, premium, production-grade result — not a generic template.

Prepared for RK Residency, Vrindavan · July 2026

HOW TO USE THIS PROMPT

This document contains one continuous master prompt (Sections 1–13). Copy it in full into your AI coding tool of choice. For best fidelity, run it in **five phases** rather than a single shot — most coding agents produce noticeably higher-quality output when scope is staged:

Phase 1 — Design system + project scaffold (tokens, fonts, folder structure, DB schema, plus review of the Section 3 reference benchmark)

Phase 2 — Public marketing pages (Home, Rooms, Experiences, Dining, Gallery, Blog)

Phase 3 — Booking engine (availability, pricing, checkout, payments, emails)

Phase 4 — Admin panel (dashboard, bookings, rooms/rates, CMS, reports, roles)

Phase 5 — SEO, performance, accessibility and deployment pass

Reality check: no single prompt — however detailed — produces a flawless production system in one pass. Treat this as a very strong brief that still needs review, QA, and iteration. Payment-gateway go-live (Razorpay/Stripe) also requires real business KYC/merchant onboarding outside of any code generation tool. Also note: this prompt was written to be original — it takes general inspiration from common luxury-hospitality site conventions and modern AI-motion-design practice, but does not copy code or content from any specific existing website, since reproducing another site's proprietary code/content isn't something I can do.

1 ROLE & MISSION

You are, simultaneously: a senior full-stack engineer (10+ years, Next.js / TypeScript / Node / PostgreSQL), an Awwwards-calibre motion & UI designer (GSAP, Framer Motion, Lenis), and a hospitality UX strategist who has shipped booking engines for 5-star properties. Your task is to design and build **RK Residency's** entire digital presence — a public marketing-and-booking website **and** a private admin console — as one coherent, production-ready codebase.

Non-negotiable standard: every screen, transition and line of copy must read as if a premium, ■5-crore-calibre design studio built it for a genuine 5-star heritage property — never a generic AI template, never default-Tailwind-SaaS grey boxes, never stock-photo emptiness. If any section feels templated, rebuild it before moving on.

2 PROJECT BRIEF

Property — **RK Residency** — a heritage-luxury residency in Vrindavan, Uttar Pradesh, India, in the Braj region on the banks of the Yamuna, a short distance from Banke Bihari Mandir, ISKCON Sri Krishna Balaram Mandir, Prem Mandir, Radha Raman Temple and Nidhivan.

Positioning — “Spiritual luxury.” A calm, dignified, heritage-inspired 5-star experience for pilgrims, devotee families and cultural travellers who still expect genuine comfort and craftsmanship.

Primary goal — Maximise direct bookings (reduce OTA commission dependence), build first-visit trust for a largely new online audience, and rank locally for searches like “hotel near Banke Bihari,” “Vrindavan luxury stay,” “hotel near ISKCON Vrindavan.”

Audience — Indian and NRI pilgrim families, spiritual-retreat travellers, devotee groups (including international ISKCON visitors), and small wedding / satsang / event bookings.

3 REFERENCE BENCHMARK — LASALA PLAZA HOTEL

Use <https://www.lasalaplazahotel.com/> (a 4-star hotel in San Sebastián, Spain) as the explicit structural and quality benchmark. If your tool can browse or view screenshots, look at this site directly. The instruction below defines precisely **what to mirror** and **what not to** — read both halves.

Mirror this site's information architecture and execution standard:

- A primary nav of clear, short labels — Rooms · The Property · Signature Experience · Gallery · Offers · Contact — with a language toggle (Hindi/English).
- A persistent trust-badge strip directly under the navbar (e.g. Best Price Guarantee / Free Cancellation / Late Check-out) — populated with RK Residency's own real policies.
- A dedicated landing page per room category — not just a shared grid card — each with its own hero image, feature list, and direct booking CTA, the way their Sea View / Historical / Suite La Concha rooms each get a full page.
- A standalone 'signature experience' page given the same visual weight as a room page — on their site this is the Rooftop; for RK Residency this becomes a dedicated Vrindavan Temple & Yamuna Aarti Experience page (timings, panoramic imagery, what to expect).
- A practical FAQ module near Rooms/Dining (accessibility, in-room amenities, breakfast/dining options, comfort/quiet-room questions).

- On-site aggregation of genuine third-party ratings (Google, TripAdvisor) alongside — not instead of — first-party testimonials, exactly as their site pulls in external review proof.

Do NOT mirror — adapt or drop these instead:

- Their exact sentences, room descriptions, photography, or any literal code — this is a structural reference only, not a source to copy from. Every word and asset in the final build must be original to RK Residency.
- Their 'Adults Only' positioning and rooftop-cocktail-bar mood — RK Residency is a multi-generational pilgrimage property; tone should stay warm and devotional, not romantic/adults-only coastal-luxury.

Reasoning, stated plainly: general information architecture and functional patterns (nav structure, having a dedicated page per room type, an FAQ block, aggregated reviews) are ordinary, widely-used hospitality-site conventions and are fine to emulate. The specific copy, images and code on lasalaplazahotel.com belong to that hotel and are not reproduced anywhere in this document or in the resulting build.

4

VISUAL & BRAND LANGUAGE — THE VRINDAVAN THEME

Colour palette (use as design tokens, not inline hex)

Peacock Teal (primary)	#0E4C4F
Temple Gold (accent)	#C7A250
Marsala Maroon (secondary accent)	#6E1E36
Warm Ivory (background)	#FBF6EC
Charcoal (text)	#231F1C

Typography

- Elegant serif with classical warmth for headings — e.g. Playfair Display, Cormorant Garamond or Marcellus (weight range 500–700).
- Clean humanist sans for body/UI — e.g. Inter, Work Sans or Sora — always legible at small sizes on mobile.

Motifs & imagery (as original SVG line-art, never clip-art or scanned images)

- Peacock-feather curves, lotus outline, temple jharokha (arch-window) frames used as image masks, a gentle diya-flame flicker micro-animation, a marigold-garland motif as section dividers, subtle Yamuna-ripple texture in background sections.
- Photography direction: golden-hour temple architecture, ghats, diyas on water, bansuri (flute) details, soft-focus marigold. Keep iconography devotional in mood but tasteful and symbolic — avoid literal close-ups of deity faces in marketing contexts unless explicitly approved by the client / temple authorities, out of cultural and religious respect.

Motion mood

Slow, reverent, cinematic — the emotional register of a temple bell resonating, not a startup-app confetti pop. Easing should favour long, soft curves (ease-out cubic / expo) over bouncy overshoot.

5 TECHNICAL ARCHITECTURE — FULL STACK

Frontend — Next.js 14+ (App Router, React Server Components), TypeScript in strict mode, Tailwind CSS driven entirely by the custom design tokens from Section 4, shadcn/ui + Radix primitives for accessible base components.

Motion layer — Framer Motion for component/page transitions and shared-layout animation; GSAP + ScrollTrigger for scroll-driven storytelling; Lenis for inertial smooth-scroll; Lottie or Rive for lightweight vector loops (diya flicker, peacock-feather sway). Every animation must respect **prefers-reduced-motion**.

Backend — Node.js via Next.js Route Handlers (or a dedicated NestJS service for heavier domains), PostgreSQL with Prisma ORM for rooms/rates/bookings/guests/content, Redis for session cache, rate-limiting and temporary room-locks during checkout.

Auth — NextAuth.js or Clerk for guest accounts; a fully separate, role-based auth flow for /admin (Super Admin, Manager, Front-Desk Staff) with JWT/session handling and optional 2FA.

Payments — Razorpay as the primary gateway (UPI, cards, netbanking for the Indian market), Stripe as a secondary option for international guests; server-side webhook verification only — never trust client-side payment confirmation; GST-compliant PDF invoice generation.

Booking engine core — Real-time availability calendar, inventory locking during checkout, dynamic rate rules (weekday/weekend/festival surge pricing for Janmashtami, Holi, Radhashtami), automatic tax calculation, confirmation + reminder emails (Resend or SendGrid), and a clean cancellation/refund workflow.

CMS — A lightweight headless layer (Sanity, or a custom Prisma-backed CMS) so non-technical staff can edit rooms, gallery, offers and blog content without touching code.

Infra — Vercel for the frontend, a managed Postgres instance (Supabase / Neon / RDS), images via next/image plus a CDN (Cloudinary or S3 + CloudFront), CI/CD via GitHub Actions (lint, type-check, test, preview-deploy per PR).

Observability — Sentry for error tracking, uptime monitoring, and structured logging specifically on the booking/payment path — this is the revenue-critical path and must never fail silently.

6 SITE MAP & PAGE-BY-PAGE MOTION SPEC

1. Home / Hero

Full-bleed looping video or cinematic golden-hour image of the ghats/temple skyline; animated logo reveal; sticky glassmorphism navbar that shrinks and blurs on scroll; parallax layering (foreground diya glow, mid-ground temple spires, background sky); magnetic-hover primary CTA 'Check Availability.'

2. About / Our Story

Scroll-triggered text reveal alongside a split-screen parallax image; animated counters for years of hospitality, rooms, and guests hosted.

3. Rooms & Suites

Masonry or carousel grid with subtle 3D-tilt hover cards, smooth image cross-fade, filter by view/type/price, and a persistent 'Book Now' micro-interaction.

4. Vrindavan Experiences

Curated temple-and-ghat guide (Banke Bihari, ISKCON, Prem Mandir, Nidhivan, Yamuna aarti) presented as a scroll-driven timeline with an embedded map.

5. Dining

Emphasise satvik / pure-vegetarian dining, in keeping with Vrindavan's pilgrimage character; icon-grid with light Lottie icon animation.

6. Amenities & Wellness

Icon-grid with restrained motion; spa/wellness section if applicable.

7. Gallery / Virtual Tour

Lightbox with smooth transitions, drag carousel, optional 360° or virtual-tour embed.

8. Offers & Packages

Seasonal/festival packages (Janmashtami, Holi) as premium cards with countdown where genuinely time-bound.

9. Testimonials

Auto-scrolling marquee, star ratings, verified-stay badges pulled from real review data.

10. Blog / Spiritual Journal

SEO content hub: temple guides, festival calendars, local tips — this is the primary organic-traffic engine.

11. Booking Flow

Sticky/floating booking widget; animated date-picker calendar; live price calculation as dates/guests change; secure multi-step checkout; a calm, reassuring confirmation animation (no confetti — a soft diya-light glow fits the brand better).

12. Contact & Location

Animated map pin-drop, WhatsApp click-to-chat, click-to-call, embedded directions.

13. Footer (site-wide)

Newsletter capture, social links, quick nav, trust badges (secure payment, best-price guarantee).

7 **BOOKING ENGINE — REQUIRED FEATURES**

- Live room-type & date-range availability, synced against a single source of truth (no double-booking under concurrent requests).
- Guest-facing calendar UI with blocked/sold-out dates visibly disabled, minimum-stay rules, and festival black-out/surge dates.
- Transparent price breakdown before payment: room rate, taxes/GST, service fee, any add-ons — no hidden charges added at the last step.
- Secure checkout: guest details, ID/KYC capture where legally required, payment via Razorpay/Stripe, server-verified webhooks.
- Automatic confirmation email + SMS/WhatsApp notification with a PDF invoice and a calendar (.ics) attachment.
- Self-service cancellation/modification within policy, with automatic refund workflow where applicable.
- Abandoned-checkout recovery email (soft, single follow-up — not aggressive remarketing).

8 **ADMIN PANEL — REQUIRED MODULES**

- Dashboard** — KPIs at a glance: occupancy %, ADR (average daily rate), RevPAR, upcoming arrivals/departures, revenue trend.
- Bookings** — Full booking list with search/filter, drag-and-drop calendar view, manual booking creation for phone/walk-in guests, check-in/check-out status.
- Rooms & Rates** — Add/edit room types, photos, amenities, base rates, seasonal/festival rate overrides, and inventory counts.
- Content / CMS** — Edit homepage content, gallery, offers, blog posts and testimonials without a developer.
- Offers & Coupons** — Create and track discount codes and seasonal packages, with usage limits and expiry.
- Reviews moderation** — Approve/hide guest reviews before they go live; flag suspicious reviews.
- Reports** — Exportable CSV/Excel reports for revenue, occupancy, and channel source.
- Roles & Audit Log** — Super Admin / Manager / Front-Desk Staff roles with scoped permissions, plus an audit log of who changed what and when.

9 **PREMIUM COMPONENT & MOTION LIBRARY STACK**

Purpose	Library
UI primitives (accessible, unstyled)	Radix UI / shadcn/ui
Utility-first styling	Tailwind CSS + custom design tokens
Page & component motion	Framer Motion
Scroll-driven storytelling	GSAP + ScrollTrigger
Inertial smooth scroll	Lenis

Lightweight vector loops (diya, feather)	Lottie / Rive
Optional subtle 3D hero accent	Three.js / React Three Fiber
Forms & validation	React Hook Form + Zod
Data fetching / cache	TanStack Query
Charts (admin dashboard)	Recharts / Tremor
Icons	Lucide

The goal of this stack is that every single component — a button, a date-picker, a card hover — carries deliberate, restrained motion so the whole product feels hand-finished rather than assembled from defaults.

10 SEO & PERFORMANCE SPEC

SEO — Next.js Metadata API on every route; JSON-LD schema for Hotel/LodgingBusiness, Review, FAQPage and BreadcrumbList; auto-generated sitemap.xml and robots.txt; Open Graph and Twitter Card tags; hreflang for Hindi/English.

Local SEO — Target local intent keywords such as 'hotel in Vrindavan,' 'Vrindavan resort booking,' 'hotel near Banke Bihari Temple,' 'hotel near ISKCON Vrindavan' — reinforced by the blog content hub and a claimed Google Business Profile.

Performance — Core Web Vitals budget: LCP under 2.5s, CLS under 0.1, INP under 200ms. Responsive images with proper sizes/srcset, lazy-loading below the fold, font-display swap, code-split heavy motion libraries so they never block first paint.

Accessibility — WCAG 2.1 AA as a baseline: semantic HTML, keyboard navigation through the entire booking flow, sufficient colour contrast even with the deep teal/gold palette, and a full reduced-motion fallback.

11 CONVERSION & ENGAGEMENT FEATURES

- Floating WhatsApp button and optional live chat, click-to-call, a visible 'Best Price Guarantee' badge.
- Real inventory-based urgency only — e.g. '2 rooms left at this rate' driven by the actual database, never a fabricated countdown. Manufactured urgency is a trust-destroying dark pattern in a pilgrimage-tourism context and should be avoided outright.
- Multilingual toggle (Hindi/English at minimum), newsletter capture with a genuine incentive, and a tasteful, non-intrusive offer surfaced on exit-intent (desktop only, capped at once per session).
- Aggregate real ratings from Google/TripAdvisor where available rather than only self-hosted testimonials.

12 NON-NEGOTIABLE QUALITY BAR

Before considering any screen finished, verify all of the following:

- Production-ready, typed, modular, componentised code with meaningful comments — never a single 2,000-line page file.
- No lorem-ipsum or placeholder copy in the final build — every string is real RK Residency brand content.
- Consistent 8px spacing grid and design tokens used everywhere; no ad-hoc magic numbers.
- Fully responsive from a 360px phone up to a 27" desktop, tested at every major breakpoint.
- Every animation has a reduced-motion fallback and never blocks interaction or scroll.
- The result must not resemble a default Tailwind SaaS template, a generic Bootstrap hotel theme, or a stock AI-generated landing page — it must look and feel unmistakably like a bespoke Vrindavan heritage brand.

13 DELIVERABLE FORMAT

- Clear folder structure separating app/(marketing), app/(booking), app/(admin), components/, lib/, prisma/, and tests/.

- A README covering setup, environment variables (.env.example with placeholders — never real secrets), and local run instructions.
- Prisma schema for rooms, rates, bookings, guests, reviews, and admin users, plus seed data reflecting RK Residency's real room types.
- Basic automated tests on the booking/payment path specifically, since it is the revenue-critical flow.
- A short deployment note for Vercel + managed Postgres + the chosen image CDN.

FINAL EXECUTION DIRECTIVE

Build this as though it will be judged by three people at once: a 5-star hotel general manager checking whether guests will trust it enough to pay in advance, an Awwwards juror checking whether the motion design is restrained and intentional rather than decorative, and a devotee visiting Vrindavan for the first time checking whether the site feels respectful of the place it represents. Every section must satisfy all three simultaneously. Re-read Section 12 before declaring anything complete.
